

ExamTrace – Agile Deliverables Report

Project:

ExamTrace – Evidence-Based Examination Monitoring & Integrity Analysis System

Deliverables Prepared

Deliverable	Purpose
Agile Template	Documents the product backlog, sprint planning, sprint activities, stand-up updates, impediments, actions and sprint retrospectives.
Defect Tracker	Records identified defects along with their description, detected sprint, defect type, assigned action, status and remarks.
Unit Test Plan	Documents functional test cases with test procedures, conditions, expected results and actual results.

Project Scope

ExamTrace is a web-based examination monitoring system designed to support secure online assessments. The system includes **candidate authentication, online assessment, webcam-based face monitoring, browser activity monitoring, violation logging, evidence capture, integrity scoring, risk classification, analytics and integrity reporting**.

Agile Summary

The project was organized into incremental development sprints. The major sprint activities covered **requirement analysis and project setup, candidate and assessment functionality, webcam monitoring, browser activity monitoring, integrity analysis, reporting, testing and final integration**.

The Agile Template maintains the development flow by tracking **user stories, sprint tasks, daily/stand-up updates, impediments, actions and retrospective observations**.

Sprint Progress

Sprint	Focus Area
Sprint 1	Requirement analysis and project setup
Sprint 2	Candidate authentication and examination module
Sprint 3	Webcam and face monitoring
Sprint 4	Browser activity and violation monitoring
Sprint 5	Integrity analysis, analytics and reporting
Sprint 6	Testing, defect correction and final integration

Defect Tracking

The Defect Tracker maintains a structured record of issues identified during development and testing. Each defect is associated with its **sprint, classification, corrective action, status and remarks**, providing traceability from issue identification to resolution.

Testing

The Unit Test Plan contains **16 functional test cases** covering the major system workflows, including **authentication, camera validation, face detection, assessment functions, browser monitoring, integrity calculation, risk classification, evidence capture, analytics and report generation**.

Development Tracking

The three deliverables together maintain a clear development trail:

Requirements → Sprint Tasks → Development → Defects → Testing → Verification
